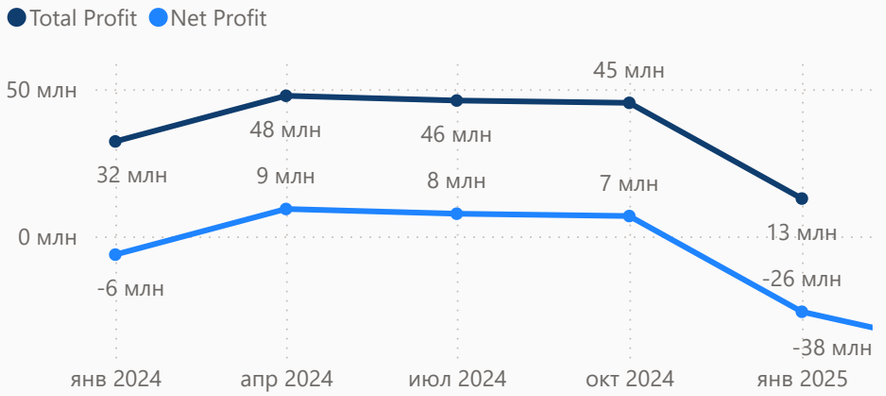
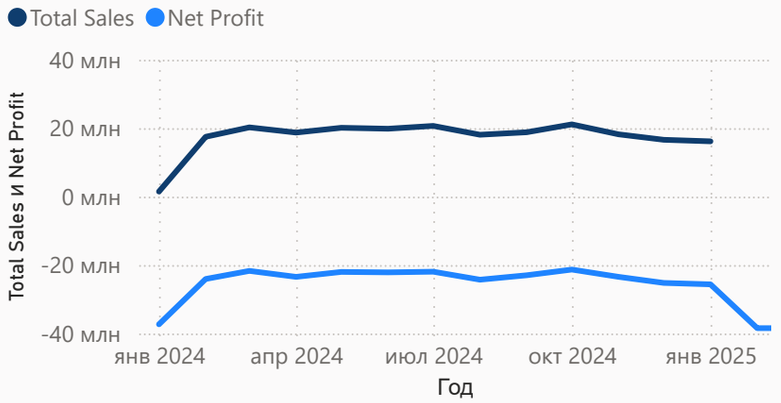
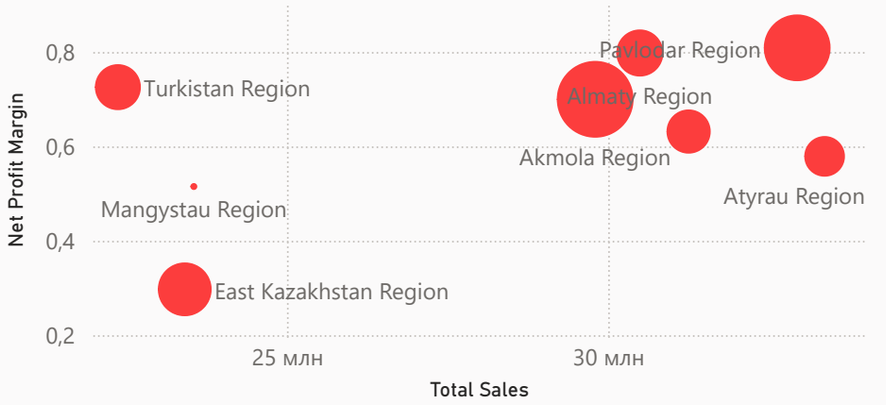
Total Profit VS Net Profit



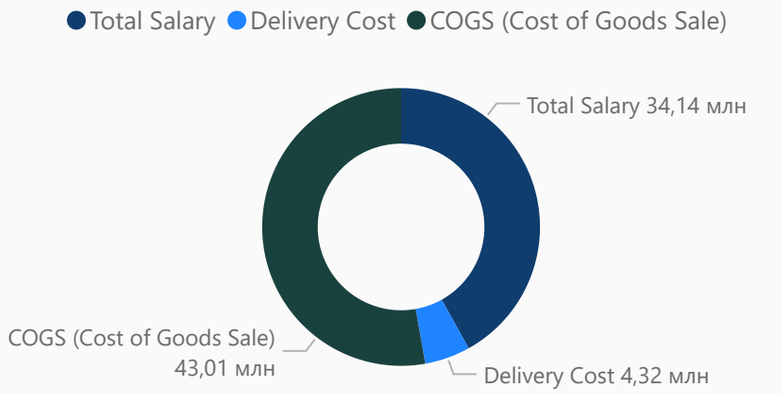
Sales Trend



Problem Regions



Total Costs Structure



Key Insights

- *The business is profitable BUT*
- *Profit overestimated*
- *High returns impact*
- *Salaries = major cost*
- *Revenue inconsistency*

Recommendations

- *Reduce return rate 17% through better product quality and delivery accuracy*
- *Optimize salary and workforce efficiency*
- *Monitor regions with high delivery costs*
- *Eliminate double counting in revenue*
- *Use Net Profit as the main KPI for decision-making*

Key Insights
The business is profitable, but real profitability is **lower than expected** due to operational costs and returns.

1. Profit Overestimation
The initial Profit Margin is **81%**, calculated based only on COGS.
However, after including delivery and salary costs, the real Net Profit Margin drops to **64%**.
This indicates that the business profitability was significantly overestimated.

2. High Return Rate Impact
The return rate is **17%**, which negatively impacts revenue and operational efficiency.
A significant portion of orders does not generate actual profit.

3. Cost Structure Analysis
- COGS: main cost driver (~19%)
- Salaries: significant operational expense (~15%)
- Delivery: relatively low (2%), but varies by region

Salaries and returns have a stronger impact on profitability than logistics.

4. Revenue vs Gross Revenue Gap
Gross Revenue (298 mln) exceeds Total Sales (227 mln), indicating:
- additional income streams
- possible double counting

Requires validation for accurate financial reporting.

Recommendations
- Reduce return rate (17%) through better product quality and delivery accuracy
- Optimize salary and workforce efficiency
- Monitor regions with high delivery costs
- Eliminate double counting in revenue
- Use Net Profit as the main KPI for decision-making

Главный инсайт
Бизнес прибыльный, но реальная прибыль ниже ожидаемой из-за операционных расходов и возвратов

1. Переоценка прибыли
Изначальная маржа прибыли составляет **81%**, так как учитывается только себестоимость.
После учета доставки и зарплат реальная маржа снижается до **64%**.
Прибыль бизнеса была существенно переоценена.

2. Высокий уровень возвратов
Доля возвратов — **17%**, что негативно влияет на выручку и эффективность.
Значительная часть заказов не приносит прибыль.

3. Структура расходов
- COGS — основной расход (~19%)
- Зарплаты — значительная нагрузка (~15%)
- Доставка — 2%

Основное влияние на прибыль оказывают зарплаты и возвраты, а не доставка.

4. Разница между Gross Revenue и Sales
Валовая выручка (298 млн) выше Total Sales (227 млн), что может означать:
- дополнительные источники дохода
- двойной учет

Требуется проверка данных.

Рекомендации
- Снизить возвраты (17%)
- Оптимизировать расходы на персонал
- Контролировать логистику по регионам
- Устранить двойной учет
- Использовать Net Profit как основной KPI
